

## Research Notes: 5

List the names of all the different types of data storage solutions that could be used by smartphone apps and their users

The only data storage solution I found when researching was the Google Cloud Platform.

Google Cloud Platform uses SQL or noSQL database options, its very fast and available in multiple countries around the world, and more. It is used by companies such as Atlassian, Spotify, GTC, PocketGems, Citrix, and Snapchat. It is basically an “app engine” that allows programmers to focus on core concepts for development.

Different products are Computing solutions, Management Tools, Big Data DB's, Networking, Identity and Security, CloudAI, an “internet of things”, storage and databases, data transfer, developer tools and API platforms and ecosystems.

You can try it for free but they do not label prices for all because as their website states there are different discounts for different companies and all packages are customized/tailored to your apps needs however there is a pricelist for “out of pocket” needs.
